

Assignment 5

Part 1 Structured System description

In this assignment we are starting to distance ourselves from the governmental analysis of the legal aspects of euthanasia and analysis of the hypothetical program for it.

Actors

- 1) Data scientists, that are monitoring the inputs of data into the LLM system.
- 2) The System itself which is a statistical algorithm of neurons with predetermined by its training weights.
- 3) The doctors who will perform the operation in accordance to the conclusion of the machine.

Rules

- 1) The AI system data is checked and inputted by human-driven systems.
- 2) The LLM for evaluation of outcomes has its weights fixed (good trained, but no continuous training)
- 3) The decision of the system is final.

Information flows

- 1) Doctor-> System-> Decision-> Doctor

Determinants

- 1) System analysing the outcomes

Contributors

- 1) LLM system making the decision

Information

- 1) Medical information Source: Hospital/Medical databases.
- 2) Personal information Source: Normalised questionnaire filled in by the patient.

Example of positive and negative decision.

Two different patients are requesting the decision of the machine for a grant of assisted suicide. They have the same age, same medical condition. The two differences are one has a full family and diagnose early stage dementia, while the other is alone and does not have diagnosed early stage dementia.

First one gets his request granted but then appealed by his loved ones, the other doesn't get his request granted, but is unhappy with the decision.
